

How IBM BOB was used

- IBM Bob was used as an AI coding and development assistant during the development of the AgriSmart platform.
- IBM Bob helped with:
 - Frontend development — creating and modifying the user interface.
 - Backend development — helping structure APIs and backend logic.
 - AI integration — assisting with the integration of AI-based crop diagnosis and analysis.
 - Code generation — generating code for different modules of the application.
 - Debugging — identifying and fixing errors in the code.
 - Feature implementation — helping implement features such as crop monitoring, weather alerts, crop diagnosis, and market information.
 - Project architecture — helping organize the frontend, backend, database, and AI components.
 - Code improvement — suggesting changes to make the application more functional and user-friendly.
- “We used IBM Bob as an AI-powered development assistant to generate, debug, improve, and integrate code for different modules of our AgriSmart project.”
